

Implementing event handling

```
Public Class Remote
    Inherits MarshalByRefObject
    Public Event MyEvent As EventHandler

    Public Sub RRaiseEvent()
        RaiseEvent MyEvent(Me, EventArgs.Empty)
    End Sub

    Public Overloads Overrides _
    Function InitializeLifetimeService()
        As Object
        Return Nothing
    End Function
End Class

Public Class Client
    Inherits MarshalByRefObject
    Private Remote As Remote = Nothing

    Public Overloads Overrides _
    Function InitializeLifetimeService()
        As Object
        Return Nothing
    End Function

    Public Sub New()
        RemotingConfiguration.Configure("Client.exe.config", False)
        Remote = New Remote
        AddHandler Remote.MyEvent, AddressOf HandlesMyEvent
    End Sub

    Public Sub RaiseRemoteEvent()
        Remote.RRaiseEvent()
    End Sub

    Public Sub HandlesMyEvent_(
        (ByVal sender As Object, ByVal e As EventArgs)
        Console.WriteLine(String.Format("Event raised by {0}", _
            sender.ToString))
    End Sub
End Class
```
